

How I went about finding the errors in the code

How I started to repair/fix the errors in the code was with reading trough all the code even before I started to change or write in it. Cause then I can easier notice mistakes a lot easier. Mistakes like written mistakes in the code. If I saw or noticed a error before I was done reading I would note to myself which line it where in and what word or sentence that where incorrect. Then I fix the written mistakes as I go and after they are done I start looking more in the browser in the inspect box to see if I get warnings or errors in there. Cause there the basic errors wills how up and it even says what line to go to. So then I go the line it mentioned and fix the fault there. Also it sometime steels you the error if the error is not to advanced. I also used a lot knowledge from the last time I took this course and used the refreshers from this semesters course. Then it was to add missing code where it was needed to make things either work or look how it was supposed to look.

References

I used the W3Schools site if I was unsure about anything or didn't remember how to layout my code correctly or if I didn't remember names on tags or which order of hierarchy tags where supposed to go.

sites name W3Schools

what part of the site did I use. I used the JavaScript tab in it and moved around in there for what ever info I needed when I couldn't remember certain rules or information.
